

RE-COOL ANTIFREEZE / COOLANTS

The Re-Cool group of products is our premium line of re-manufactured extended life 50/50 antifreeze / coolants that utilize a state-of-the-art Hybrid Organic Acid Technology (HOAT) inhibitor package to excel in both light duty and heavy duty industrial applications.

Previously, downhole disposal was the only acceptable method for disposing of used antifreeze. However, the molecular integrity of waste antifreeze remains intact and the fluid can have an infinite life if it is properly maintained. **Re-Glycol 2014 Ltd.** has refined a process utilizing closed-loop distillation technology that can restore over 95% of waste fluid to a like-new state.

All of our re-manufactured fluid is tested to ensure it meets the requirements of ASTM D7713. The fluid is then blended with our inhibitor package to produce an extended life coolant fluid that exceeds ASTM D3306 or D4985, and D6210/11, and the Maintenance Council of the American Trucking Association's RP329/388.

The HOAT inhibitor package is an extended life, low-silicate, non-phosphate product that combines organic salts with conventional inorganic salts and azoles, making it compatible with all types of both extended life and conventional technology antifreeze/coolants. These inhibitors give year-round protection against freeze-ups, boil-overs and engine cooling system corrosion, and disperse minor oil leakage, control hot surface scaling and prevent fouling.

Whether you need light duty automotive coolant, heavy duty antifreeze for diesel or natural gas engines, or the arctic blend for cold weather applications, we have a coolant for you today.

All glycols re-manufactured at Re-Glycol 2014 Ltd. are independently tested to ensure quality control of the product before it leaves our facility.
